This is just to vent.

I was clearly not auditing patches well enough earlier and the above patch got modified since the version I wrote initially. Adding a few addition is_init calls where what we care about test is not is the real init process of the system (so we should treat it with care) but is this the pid == 1 in my pid namespace.

So now we (or maybe me) are going to have to through all of those is_init references and undo the changes for the ones that don't apply to the global init.

Guys, please, please be more careful.

The one that set me off is the one in will_become_orphaned_pgrp.

Eric
