At layer-2, you can already do this by adding the etun device to a  
bridge and let the bridge  
do the work.

At layer-3, you can use the routing tables...and all of the other clever  
logic of the linux  
kernel.

Imagine what you could do if you had 2000 ethernet ports on your machine  
and lots of  
loop-back cables..that is essentially what etun gives you...

Lord knows I love writing virtual devices..but it always seems to turn  
out best if you  
leave each piece simple and use the normal linux tools and features to  
put the simple  
features together into something much more powerful.

Ben
