I am attaching two patches that I had done way back in Oct 2006 with Al Viro. I had sent these patches to Al Viro. But I forgot to follow them up, I guess so did Al Viro.

The first patch disambiguates multiple mount-instances of the same filesystem (or part of the same filesystem), by introducing a new interface `/proc/mounts_new`.

The second patch introduces a new proc interface that exposes all the propagation trees within a namespace. It does not show propagated mounts residing in a different namespace (for privacy reasons). Maybe one could modify the patch a little, to allow it; if the user has root privileges.

RP

PS: Sorry these are attachments instead of inline patches. I am scared of inlining in evolution. If needed I can send inline patches through mutt.
