In addition, it should be a thread and not done from within keventd
because :

- It can take a long time (well, relatively but still too long for a work queue)
 - The driver callbacks might need to use keventd or do flush_workqueue to synchronize with their own workqueues when doing an internal recovery.

I think moving to kthread's is cleaner (just a wrapper around kernel threads that simplify dealing with reaping them out mostly) and I agree with Christoph that it would be nice to be able to "fire off" kthreads from interrupt context.. in many cases, we abuse work queues for things that should really be done from kthreads instead (basically anything that takes more than a couple hundred microseconds or so).

Ben.
