Subject: Define/use task_active_pid_ns() wrapper

From: Sukadev Bhattiprolu <sukadev@us.ibm.com>

A process is visible in one or more pid namespaces, as it is known by some pid_t in every ancestor pid namespace. Every time the process forks, the child process also gets a pid_t in every ancestor pid namespace.

While a process is visible in >=1 pid namespaces, it can see pid_t's in only one pid namespace. We call this pid namespace it's "active pid namespace", and it is always the youngest pid namespace in which the process is known.

This patch defines/uses a wrapper to find the active pid namespace of a process. The implementation of the wrapper will be changed in subsequent patches when support for multiple pid namespaces are added.

Changelog:

2.6.21-rc6-mm1:

- Rename task_pid_ns() to task_active_pid_ns() to reflect that a process can have multiple pid namespaces.
