By saying complex I didn't mean that this is difficult to implement,  
but that it consists (must consist) of many stages. I.e. composite.  
Making the device right in the namespace is liter.

I do not mind that.

Agree. Moving the devices is a must-have functionality.

I do not mind making the pair in the init namespace and move the second  
one into the desired namespace. But if we *\*always\** will have two ends in  
different namespaces what to complicate things for?

Thanks,  
Pavel
