
Subject: Slackware VPS problem

hi,

I just installed some slackware packages in a chroot environment under /vz/private/888. I sort of followed the guide on making a debian template. When I tried to start the vps, I get the following error.

```
vzquota : (error) quota check: crossing mount point  
vzquota init failed [8]
```

/vz/private/888/ is on its own partition. Maybe that's the problem? if that's the case, how do I fix this?

I'm quiet new to linux and all, so maybe someone can point me to some how-to or guides regarding this, instead of walking me through step by step.
