you could add the XtreamOS project to the list. It's grid project and we need to use containers for grid job isolation. We're currently using BLCR for checkpointing, and also kerrighed, but aim at switching to containers and will work on container checkpointing. XtreamOS is related to kerlabs & kerrighed, but has broader interests in containers.

By the way, there are potential synergies between container checkpointing work and the need of the VM to have something like per cpuset of per container swap (as explained in the VM BoFS at OLS, there are unnecessary OOMs with a common swap).

Regards,
Erich
