And I'm not sure that should be the case.

In my view, root of a container is equivalent to a normal user on the host system, just like root in a qemu process.

> E.g. consider root user hit the limit. After that you won't be able to login/ssh to fix anything.

That's fine in the container.

> NOTE: container root can have no CAP\_SYS\_RESOURCE and CAP\_SYS\_ADMIN as it is in OpenVZ.

And eventually we'll want that to be the default in upstream containers. But it's not the case upstream right now. Before we can do that, we need an answer to per-container capabilities.

Do you (either you specifically, or anyone at openvz) have plans to address the per-container capabilities problem? Herbert? Eric?

I'm interested, but would like to get the file capabilities squared away before I consider coding on it.

> But in general I'm not against the patch, since in OpenVZ we can replace the check

If that truly suffices then great. If not, then in order to support openvz in the meantime I say we drop my patch, but we remember that when we straighten out the security issues this will need to be addressed.

thanks,  
-serge
