```

This seems a bit inconsistent - if you write a value to a limit file, then the value that you read back is reduced by a factor of 1024? Having the "(kB)" suffix isn't really a big help to automated middleware.

I'd still be in favour of just reading/writing 64-bit values representing bytes - simple, and unambiguous for programmatic use, and not really any less user-friendly than kilobytes for manual use (since the numbers involved are going to be unwieldy for manual use whether they're in bytes or kB).

Paul
