
Subject: [RFC][patch 1/3] network container subsystem
Posted by [Daniel Lezcano](#) on Tue, 04 Sep 2007 17:00:23 GMT
[View Forum Message](#) <> [Reply to Message](#)

From: Daniel Lezcano <dlezcano@fr.ibm.com>

This patch creates the network container subsystem.
It consists for the moment on a single file "network.ipv4".

The interface is pretty simple:

To add an IP address to the container:

```
echo add AB12FFFF > network.ipv4
```

To remove this IP address:

```
echo del AB12FFFF > network.ipv4
```

To list the addresses:

```
cat network.ipv4
```

The parameter is an IPV4 address in the hexa format. The parsing of a dotted-decimal parameter is totally painful. If this format hurts someone, I can change it to a dotted format at the risk of having something buggy.

This patch by itself does nothing more than adding/removing elements from a list.
