I think Paul wants the /\* \*/ after your endif as well to reduce patch conflicts.

```

Hmm, i assume you'll need to take this read\_lock during all of the lsm hooks then? So rCU might be a far better choice so you can just grab rCU\_read\_lock in the lsm hooks.

```

```

Heh, well you'll definately want to define can\_attach() to prevent a task simply entering another container, right?

> + .attach = NULL,

```
