---

Hi,

I am using OpenVZ since about 3 months now. On a new host server (32bit system, 1 GB RAM, CentOS 4.2) I set up a debian VPS (based on the template provided on your FTP server). Now the problem is that I get a REALLY high failcount for kmemsize. It is completely irrelevant what values for KMEMSIZE I use I always get nearly the same values. The problem is that the value is already that high about 1 second after start.  
I really hope someone of the developers can help me.

First, here is the output of /proc/user\_beancounters:

Version: 2.5

uid	resource	held	maxheld	barrier	limit	failcnt
0:	kmemsize	1859563	2704948	2147483647	2147483647	0

Here is the output of `uname -a`:

```
Linux master.my-domain.net 2.6.8-022stab070.1-enterprise #1 SMP Mon Feb 20 19:31:28 MSK
2006 i686 athlon i386 GNU/Linux
```

Here is the config file of VPS 22114:

```
ONBOOT="yes"
```

```

```

I really hope this is enough information such that someone of the developers/supporters can help me.

Thanks

Bernhard
