Hi,

How can I reaset the failcount in /dev/user_beancounters ?

In previous cases I just restarted the hardware node to be sure that everything is in a defined state.

Because this time I have to do this on a production system I don't want to reboot the hardware node. I hope there is another way to do this without even restarting any of the VPSs. If so, please explain it to me (or just say it is described in document X).

Bernhard
