Quote:

Also you can translate PID -> VEnum via /proc/<pid>/status file,

```
$ grep envID /proc/self/status
```

```
envID: 9027
```

Thanks , very helpful .

main point you cant do "vzctl exec 0 ", so /proc envID is solution.

vzps also ok,saves time for writing script , but for ports i will need to write script anyway , getting pid via lsof and eventually VEID.
