Well, now that you ask... I do not believe this to be a bug in vzquota.
Many of our VPSs were P2V conversions, and I suspect that that's how the
quotas started off badly. I SFTP'd the fles from their server on the HN,
but didn't flush the quotas at the time.

But, I am curious whether 'drop -f' and 'on -f' have any potential for
mischief if used on a running VE. It would be nice to get the quotas
updated without booting our customers.
