Hello Devs, I need your help.

Kernel: ovz028stab039.1
CPU: 2x quad core 2.33 xeon
mem: 32GB
disk: Emulex Corporation LP9000 Fibre Channel, local sata disks

When doing a really long read from the fiber channel card and write to the local disks, say 20+GB which takes 45 minutes or so, example when backing up a VE, the OOM is triggered:

<http://208.77.99.251/oom.txt>

Can you help me understand what is happening?

Thanks!
Rick
