zoom,

- 1. I really believe for a firewall, which should run on different distributions this should not be a problem. Can you describe exactly, what do you do with it, how try to configure it and how it refuses to work? Maybe you can give us an access to your node, so that we checked and resolved it quickly. If so, send me a private message with credentials. If not, it is ok.
- 2. Actually these modules present in OpenVZ kernel sources, they are just not compiled by default in our binary distribution.

Corresponding to these 4 modules config options are:

CONFIG_IP_NF_MATCH_PKTTYPE CONFIG_IP_NF_MATCH_PHYSDEV CONFIG_IP_NF_MATCH_OWNER CONFIG_IP_NF_RAW

You can try setting them to 'm', recompile the kernel and check whether it helps. If you are unfamiliar with kernel recompilation procedure, we can describe it to you in more details.
