All,

I'm new to the openvz. Recently I came across a problem that the VPS exceeded the numfile limit. According to the document, numfile means number of open file. So I ran a lsof command on the VPS it does not match with the value numfile in /proc/user_beancounters. Right now numfile shows 8000+ file being opened when lsof is showing only 800+ files? Am I missing something here?

thanks,

John
