Subject: bar/lim for privvmpages
Posted by Dietmar Maurer on Mon, 08 Oct 2007 13:24:24 GMT

Hi all,

Documentation says:

> There should be a safety gap between the |barrier| and the |limit| for
> |privvmpages| parameter to reduce the number of memory allocation

But I cant find any hints how large that should be. I already looked at
the code in vzctl-3.0.18/src/validate.c, but was unable to find
something.

I want a privvmpages limit of 1GB - whats the suggested barriere for
that?
