dev,

First, thanks for your help. I've been fighting with this problem for a couple of days now. The reason I suspect it might be a kernel problem is because the script works fine using the original kernel. I don't believe it has anything to do with my shorewall settings simply because it works fine under that situation.

Anyhow, I tried setting the items you indicated and recompiling the kernel. I did run in a couple of problems with it. First I tried the simple thing which is just to build a new kernel from it's sources in place.. no changes.

```
rpm -ivh ovzkernel-2.6.8-022stab072.2.src.rpm
rpmbuild -bb --target=i686 /usr/src/redhat/SPECS/kernel-ovz.spec
```

The problem is that in the end I did get an RPM built, however it wasn't what I was expecting. The RPM created in /usr/src/redhat/RPMS was

```
ovzkernel-debuginfo-2.6.8-022stab072.2.i686.rpm
```

Am I missing something??
