Subject: Kernel 2.6.18-openvz-13-39.1d1-amd64 oops
Posted by Martin Trtusek on Wed, 10 Oct 2007 05:54:11 GMT
View Forum Message <> Reply to Message

I installed kernel 2.6.18-openvz-13-39.1d1-amd64 from http://download.openvz.org/debian on Debian Etch one week ago and experienced kernel oops (complete freezing, off/on necessary) after 2-3 days of running (3 times). Oops is always after cron.daily scripts (in my case 06:25) but not everyday. Yesterday I configured netconsole for capturing useful info, enclosed.

Hardware was tested very strong on installation. With stock Debian kernel (initrd.img-2.6.18-5-amd64) server does not have any problem (3 months of operation). There are 3 VPS running, without really using.

Enclosed last entry in syslog (before crash). Looks like problem is invoking by /usr/share/vzctl/scripts/vpsnetclean
or /usr/share/vzctl/scripts/vpsreboot. Booth scripts are from vzctl package, I installed it from http://debian.systs.org/

vzctl --version
vzctl version 3.0.18-1dso1

I am leaving office now, additional info (if necessary) I can send tomorrow.

Martin Trtusek
