Most likely there answer is - possible, but not easily.
vzctl requires access to some of vps files, global
configs, ve configs etc. Theoretically it can be fixed
and adopted (e.g. to have 2 global configs: one in VE0 for
admin VPS start and one in admin VPS; files from all VEs
can also be accessiable via bind mount to admin VE),
but on practice no one tried it.

Thanks,
Kirill
