Bonjour a Tous,

2.6.22 kernel based src.rpm file DO NOT generate package "devel" when an RPMBUILD is done.

RHEL5 openvz kernel spec file does it.

Generating the devel package is mandatory to have some other application (ie: nvidia drivers) to be installed on the openvz kernel.

I have tuned the 2.6.22 kernel.ovz.spec to generate devel package, but it may still need fine tuning before (if) included in current openvz distribution.

What is the "openvz devel team" position about having the spec file to generate kernel devel package?

--

A bientôt
