dev

When I started to install OVZ all my IP's were homed to the box. This file covered all the IP's except the main server IP:

ifcfg-eth0-range0
Start

IPADDR_START=72.123.123.123

IPADDR_END=72.123.123.130

CLONENUM_START=0

END

(IP changed for security purposes)

I renamed this file OLDifcfg-eth0-range0

then /etc/init.d/network restart

At this point I could add IP's via "vzctl set" and everything functioned correctly. Prior to renaming the file the IP's added via "vzctl set" added normally to the VPS but the VPS was without network connection. I was just curious if this was the correct way to do this. Hope I was clear enough.
