Hello Svetlin!

Well, i guess that something failed during the initrd creation (in the kernel's rpm postscript) and thus initrd was not created. This led to the inability to boot the kernel.

Could you please check the bootloader config, if there initrd image configured for the newly installed kernel? If yes, could you please check that image file (mentioned in bootloader config) exists and has approximately the same size as stock openSUSE kernel has.

Regards,
