Subject: Re: yum troubles on centos 5 x86_64

I just saw this problem yesterday. In addition to rebuilding the RPM database, I needed to re-run yum in the VPS, say "yum update" and after that, vzyum would work fine.

What's interesting is that in the posted centos5 minimal and default templates, the various /vz/template/centos/5/i386/config
pre and post scripts make mention of this though they are commented out. I think they should be brought back with the addition of a yum pass.
