from what you wrote, it looks like you mostly care for CPU. then you simply need to setup mysql VPS to have x10 times more cpuunits than other VPSs.

e.g.

```
# vzctl set MYSQL_VPS_ID --cpuunits 10000 --save
```

```
# vzctl set OTHER_VPS_ID1 --cpuunits 1000 --save
```

```
# vzctl set OTHER_VPS_ID2 --cpuunits 1000 --save
```

to make it more secure, I recommend you to have `_only_` mysql inside mysql VPS. no ssh, and other such things...
