Subject: yum.repo per VE

Hi all,
is there any way to set yum repo personally for a VE ? For example:
I have HN with 3 VE, all of them are with centos-4 template. 2 of them (let's be named 1001 and 1002) uses standart centos packages and updates and in this case initial yum.conf for vzyum is more than perfect. But in third VE (1003) I wish to use some packages from external for centos repository (example: amavisd-new from dag). I know that is possible to download necessary rpms from repo and install them by rpm command but this is little dependancy hell (because so many additional perl modules needed) and is more problematic for future support. I know that can add repo to global yum.conf file but then this repo will be for all VEs. Do is possible to make it available only from one of all VE ?

Best regards and sorry for my bad english !
