Hi,

vzyum is a yum wrapper and it's main benefit that you can share yum cache between VPSes. If you want to install the same packet on 2 VPSes you don't have to download it 2 times, because vzyum uses the common cache. So it uses the same conf files for all VPSes.

You can install yum on VPS(1003), make into VPs your own repo file and use yum inside VPS.
