Hi,

It is my first time to use the openvz. I downloaded stuff (kernel-patch, vzctl vzquota) by apt-get on my Debian4 and installed them according the instructions of

[http://wiki.openvz.org/Installation\\_on\\_Debian](http://wiki.openvz.org/Installation_on_Debian)

However, when I rebooted my computer, I got a error message in system booting:

....

```
[ 10.543572] VFS:Cannot open root device "sda1" or unknown-block(0,0)
```

```
[ 10.543635] Please appedn a correct "root=" boot option
```

```
[ 10.543697] Kernel panic - not syncing : VFS: Unable to mount root  
fs on unknown-block(0,0)
```

what is matter with it?

My running environment is Debian4 on VMware 5.5.

Thanks!

Best washes,

Ian
