Subject: Re: OpenVZ on x86_64: vzyum, vzpkgcache and vzrpm still broken?

That's bad, and difficult to tell, what to do. On one hand, that dual Xeon EM64T machine only has 3 GB RAM (and it was not intended to add more, especially because all memory slots are already in use), on the other hand what's the point to have a 64bit server, if only used with a 32bit host-OS & VE's.

Are you sure, that if the host runs on 64bit, it does not matter at all, if a VE is 32 or 64 bit?
