In where I should enable the IP forwarding, host system or VE (Sysem image file)?

I enabled the IP forwarding in /etc/sysctl.conf in host system (by copying configuration directly from http://wiki.openvz.org/Quick_installation#sysctl), but it isn't work; it is same when enabled in VE.

I used the real IP. For example, host IP address is 192.168.8.54, and I set the IP of VE is 192.168.8.55. Both are effective IP addresses.

Then, I started VE.

Under above setting, I entered VE and run apt-get update. However, I got error message.

No matter what IPs I pinged, all can not make connection.

What should I do next? Could anybody give me some advices?

Thanks,

Ian
