Sorry for not pasting it in but it's inferred from this thread as AutoFS works without issue from the main physical machine's OS. Regardless, to be complete, the autofs module IS loaded on the physical machine's OS:

/sbin/lsmod | grep auto autofs4 24324 8

The VPS doesn't have any modules according to Ismod nor does using modprobe to install autofs have any effect:

[root@dolly-centos5-A /]# /sbin/lsmod (returns to the cmd prompt without any info)

[root@dolly-centos5-A /]# /sbin/modprobe autofs

[root@dolly-centos5-A /]# /sbin/lsmod (returns to the cmd prompt without any info)
