2) The "mount" command shows the source of the mount as "nfs" and not the IP address (like what it does on the physical machine shown above. Seems minor but might mean something

```
[root@dolly-centos5-A /]# df
Filesystem      1K-blocks    Used Available Use% Mounted on
simfs           2389512   365772   2023740   16% /
nfs             948779200 103575840 797008192   12% /mnt
```

It depends on coreutils version.

I also checked 2.6.18-8.1.14.el5.028stab045.1 kernel and it works with nfs+autofs!

Please send me by e-mail detailed your system configuration and I will try to help you.
