I think 02 Gbit ethernet cards are fine - but if u really have so much traffic between HNs, u can use 03 cards and make a bond with 2 of them.

Load Balance in a High Availability scope, i think to put services in both HNs, each inside of VPSs, in alternate state - like this:

HN01	HN02
[vps01-apache-active]---	[vps01-apache-standby]
[vps02-mysql-standby]---	[vps02-mysql-active]
[vps03-proftp-active]---	[vps03-proftp-standby]
.	
.	
.	

But if u want load balance in a application scope, maybe this will help u - <http://www.linuxvirtualserver.org/>

About distro, some facts: OpenVZ manual and general instructions are driven for RH distros (RHEL, CentOS, Fedora) ,but i think this is like soccer teams - your team is better than your friend's team
