03:19Well this does not look like a good solution, since having all nfs

mounts for all VE in VE0 is not secure not. Can you explain why this is a problem to migrate the lockd process and if this will or can be fixed in future releases of OpenVZ?

And also why i can't see the lockd process in VE0?

Can you please give me an access to your node? Send credentials via PM if you can.

If you can't give me an access then please describe your configuration (post here VE config and commands you use to mount nfs inside a VE)

Hi Andrey,

It looks like lockd is not the real problem

i've tried just to suspend a VE and got that nfs filesystems is not supported.

```
# vzctl ckpnt 102 --suspend
```

Setting up checkpoint...

suspend...

Can not suspend VE: Invalid argument

unsupported fs type nfs

Checkpointing failed

So even if i mount nfs with nolock option it's not going to help.

Also i've found http://bugzilla.openvz.org/show_bug.cgi?id=616

Are you planning to work on this enhancement in the near future, or i can just forget about it?

Thanks

Alex
