Hello All,

I want to use a NFS server for the /vz partition.

I mounted it on the VE0 of each HN. The server is running CentOS 5, without openvz. The HNs have openVZ RHEL 5 based, release 2.6.18-8.1.8.el5.028stab039.1

Everything is working ok, except that for every VE start and stop, the following messages are issued:

```
lockd: cannot monitor <nfs_server address>
```

I disabled the DISK_QUOTA.

I search this forum and the list, but I couldn't find any explanation for this kind of problem.

Should I give any other information ?

I don't have any other idea to fix it. I accept any suggestion.

Thanks in advance,

Lauro.
