Hi,

1. As I can see from your post, command df has shown various consequence from command du. It can be happened when any process used some files, which you had removed from their directory; but they didn't actually delete from the file system, because somebody used it. May be command "ls -l | grep deleted" will help you to find out such files.
2. If it is possible, can you conduct this experiment, when the second level quota is off, because it's hardly that quota is the reason of a problem.

Thank You!
