You can build templates from this nice metadata package:
<http://forum.openvz.org/index.php?t=review&th=2512&rid=1623>.

To get a x64 VPS you simply replace every occurrence of i386 with x86_64. I copied over
/vz/template/centos/5/i386 to x86_64 and changed all files with the new links. Works like a charm!
