I am not an "OpenVPN guru", but it would be helpful if you could post the full server & client config files if they differ from the examples I posted.

If I understand it correctly - the 192.168.0.0/24 IPs are used by your "real" network adapter and the 192.168.201.0/24 subnet is used by the VPN TAP Virtual Network Adapter, right?

If it is so it looks almost as if it was all reversed. I mean, in my log the first "route ADD" record looks like this:

```
"route ADD VPN_PUBLIC_IP MASK 255.255.255.255 172.23.35.10"
```

172.23.35.10 is my "real network adapter" gateway.

Hmm... just thinking aloud but what does this line look like in your client config file:

```
"remote PUBLIC_IP_OF_YOUR_VPN_SERVER 1194"
```

Is the "PUBLIC\_IP\_OF\_YOUR\_VPN\_SERVER" really a public IP in your config file?

Tomas
