Subject: Problem with disquota and creating a VPS with plesk

Hello,

I created an image with debian etch and plesk 8.2.1. When I want to use this image as an ostemplate, I get the following error:

tar: ./etc/alternatives/javac.1.gz: Cannot create symlink to
`/usr/share/man/man1/javac.j2se14.1.gz': Disk quota exceeded

There are some more errors with "disk quota exceeded", when I create a new VPS with this ostemplate.

How can I solve the problem, because the harddisk has enough space.

Thank you very much,

Tony
