man and search your best friends. Laziness - not.

```
# vzctl --help | grep iptables
[--iptables <name>] [--disabled <yes|no>]
```

From vzctl man page:

#### Iptables control parameters

--iptables name

    Restrict access to iptables modules inside a VE (by default all iptables modules that are loaded in the host system are accessible inside a VE).

You can use the following values for name: iptable\_filter, iptable\_mangle, ipt\_limit, ipt\_multiport, ipt\_tos, ipt\_TOS, ipt\_REJECT, ipt\_TCPMSS, ipt\_tcpmss, ipt\_ttl, ipt\_LOG, ipt\_length, ip\_conntrack, ip\_conntrack\_ftp, ip\_conntrack\_irc, ipt\_conntrack, ipt\_state, ipt\_helper, iptable\_nat, ip\_nat\_ftp, ip\_nat\_irc, ipt\_REDIRECT, xt\_mac.

Please, be assured, that all necessary iptables modules are loaded before the start of vps
