
Subject: Migration error: VPS config file does not exist

Hi,

I met a problem when I migrated a VE client from one host to another. The two hosts are installed Debian 4 and OpenVZ. In one of the host, I have installed successfully the VE client. Then, I copied the directories and files in /vz/private/ to another host. For example, I tared all the file in /vz/private/101/ of host 1.

```
# tar cf 101.tgz 101
# ls 101.tgz
101.tgz
```

Copy the tgz file to another host,

```
# cd /vz/private/
# tar xzvf 101.tgz
```

Then I created a directory with the same name in /vz/root/

```
# cd /vz/root/
# mkdir 101
```

Ok, all are ready and I started the VE with the id, 101:

```
# vzctl start 101
VPS config file does not exist
```

I don't what is wrong with it. Maybe some configuration files are not ready for this migration.
Could anybody give me some advices?

Thanks in advance.

Ian
