Subprocess for bash starts running inside VE 180, begins executing
hi.sh. It's got a different environment, and expands $HOME into /,
then echoes it to stdout.

> server3:~# vzctl exec 180 echo $HOME
> /root

Current shell expands $HOME into /root. Subprocess for echo starts
running inside VE 180, with the parameter already expanded. (vzctl
doesn't even see the "$HOME".) It is told to echo "/root" to stdout,
so it does.

Does that sound about right?
