Dear Community,

I have stuck with one problem and need your help.

We have two HN's with one VE on each. Each HN have 3 interfaces: two merged into bond0 (private network between two HN's) and one eth2 on each node is Internet interface.

Private network is 10.0.0.xxx (HN1 bond0 is 10.0.0.1 and HN2 bond0 is 10.0.0.2).

I would like to transfer data from one VE to another between HN's over private network. Now if I just add 10.0.0.x addresses to each VE (on different HN's), then request goes through private network (bond0), but reply through Internet (eth2). But maybe I mistake and they go completely over eth2.

I've already seen wiki article about venet and veth, but it's production HN's and I don't want completely mess things up doing my research and tests.

Please provide mini how-to add VEs into private network (bond0 interface) without losing Internet access to VEs (I mean primary route through eth2).

Thank you forward!
