
Subject: [RFC][PATCH][LLC] Use existing sock refcnt debugging
Posted by [Pavel Emelianov](#) on Fri, 09 Nov 2007 14:43:56 GMT

Hi, Arnaldo.

I've grep-ed through the code and found one more place, where the sk refcnt debugging is required, but is still performed in an old fashion - this is the LLC2.

The problem in using the sk_refcnt_debug_xxx here is that these socks do not provide the sk_destruct callback to catch the moment of the sock destruction.

Making this callback mandatory is not a good solution, as most often it will be empty and thus useless. Making this callback be set under the #ifdef SOCK_REFCNT_DEBUG is even more ugly than the previous one.

So, I propose to extend the sk_refcnt_debug_xxx set of helperf for those socks not having the sk_destruct callback by default, like the LLC2 ones.

The new helper is sk_refcnt_debug_inc_undo(sk) sets the sk_destruct callback into the sk_refcnt_debug_dec() in case the SOCK_REFCNT_DEBUG is on.

What do you think about it?
