ip_forward was enabled but it still didn't work. Enabling firewall in the conf didn't help either. I need iptables to monitor bandwidth so its important.

I dropped down to a 2.6.20 kernel, applied patches and config and compiled/installed. Everything now works ok.

What is wrong with this kernel (2.6.20 ?). Anything I should watch out for? I see that development on it has been stopped and only 2.6.22 is being worked on.
