Hi All...

I thought this issue was resolved with the last kernel upgrade I did, but this morning at about 6:25AM Eastern (I think) one of my OpenVZ machines experienced a kernel panic.

The kernel is:

```
actual:/var/log# uname -a
```

```
Linux actual.registrationtek.com 2.6.18-openvz-13-39.1d1-amd64 #1 SMP Sat  
Sep 29 15:02:55 MSD 2007 x86_64 GNU/Linux
```

This is Debian Etch AMD64 running on Supermicro hardware.

The messages log is not much help. I rebooted at about noon:

```
Nov 12 05:43:37 actual -- MARK --
```

```
Nov 12 06:03:37 actual -- MARK --
```

```
Nov 12 06:23:37 actual -- MARK --
```

```
Nov 12 06:27:29 actual syslogd 1.4.1#18: restart.
```

```
Nov 12 12:00:44 actual syslogd 1.4.1#18: restart.
```

```
Nov 12 12:00:44 actual kernel: klogd 1.4.1#18, log source = /proc/kmsg  
started.
```

```
.  
. .  
. .
```

Same for syslog. Here are the last few lines:

syslog.0:
