1. which kernel do you use? if 2.6.8 have you tried this from the FAQ:

Quote:

Q. My node is unaccessible through the network after reboot...

A. You need to check your firewall rules. The problem is that default stateful firewall rules are not available on the host system. To make this functionality available, load the ip\_conntrack module with the additional parameter "ip\_conntrack\_enable\_ve0=1". However, this method is highly not recommended because tracking all the connection on the host system lead to performance degradation, more memory usage and also may lead to the total server inaccessibility due to reaching of the overall connection limit.

?

2. sorry, I didn't get your question/explanation about venet0. As far as I can see from your ifconfig output eth1 is activated, and I can't catch how is it related to venet0...

can you please make it more clear? what messages are printed when it fails to activate? why do you think is it not activated (in your output it is UP!) ?. Which commands do you use to activate it and which fail?
